Asset Management and CMMS Work Flow in System 800xA

Why should operations get involved in the maintenance team work flow?

How can I add condition monitoring to equipment which has no communications pathway?

What are the benefits provided by an integrated Asset Management solution?

Plant assets include a range of equipment from field instrumentation to control system components. Failure in any of these may result in loss of production and in some cases compromise safety.

System 800xA accesses the wealth of information provided by today's intelligent plant assets. This potentially valuable information is available from a simple right click on the device graphic element, or via the dedicated maintenance workplace. Instrument protocols such as HART, PROFIBUS, FOUNDATION fieldbus and wireless are supported ensuring compatibility irrespective of device type and provider.

To supplement this extensive diagnostic capability, 800xA also has the capability to seamlessly integrate with Computerised Maintenance Management Systems (CMMS). In the event of a device fault, this permits automatic creation and tracking of work orders within an enterprise asset management system e.g. Maximo, SAP.

Who should attend?

This session addresses both the technical and commercial benefits of field device asset management and integration with enterprise asset management systems.

It is equally suitable for management to realise the potential advantages of an integrated maintenance strategy as well as 'front line' operational and maintenance personnel.

Benefits of attending

- Understand why and how to add asset condition monitoring
- How to capture knowledge to help fault drilldown
- Reporting options to reduce operator workload
- More effective collaboration and hand over reports

Topics covered

- Drivers and benefits for asset management and CMMS integration
- Review of the latest field instrument technologies, standards and protocols
- Review of existing instrumentation and solutions to 'gather' additional diagnostic data
- Functional description: scenario of device fault through to work order placement, tracking and resolution
- Further capabilities: predictive maintenance, network infrastructure and system monitoring
- Asset condition information and reporting

Duration: 1 or 2 hour session followed by optional discussion session or live demonstration

Venue: ABB offices in Cambridgeshire, Aberdeen or customer location
